PACIFICHEM CORRO CRP CHEMICAL PROCESS PUMP WITH VORTEX IMPELLER

A new development within the range of the Pacifichem Corro CRP non-metallic chemical process pumps has been the design and manufacture of the well proven pump with a new vortex type impeller. The new pump is as a result of customer satisfaction with the existing range of Pacifichem Corro CRP pumps, which come standard with an open impeller design and process plants requirement to be able to handle corrosive liquids with increased amounts of solids in suspension.

The newly designed Vortex pump is a quality heavy duty non-metallic chemical process pump based on the existing CRP range but with the added advantage of being capable of handling aggressive chemicals which contain increased amounts of solids in suspension.

The following photograph's shows the new design.
